PILOT TESTING PROGRESS UPDATES	37
CONCLUSION	40

INTRODUCTION

This report is based on a pilot testing session conducted for the MiWAYZ ride-hailing mobile application. The objective of the testing was to evaluate the system's usability, identify functional and non-functional issues, and propose improvements to enhance the overall user experience.

During the testing process, key ride-booking functionalities including live location tracking, pickup point handling, multi-destination support, and ride status updates were systematically evaluated. Observations were documented along with screenshots and analysed to highlight usability gaps, inconsistencies, and potential areas for improvement.

As an undergraduate student with an interest in data analysis, QA testing, and software development, this report aims to present practical observations, demonstrate problem-identification skills, and provide user-focused recommendations based on real-world application usage.

IDENTIFIED BUGS

This section presents a consolidated overview of all issues and observations identified during the testing and evaluation phases of the application. The findings are arranged according to the testing timeline to support easier tracking of system behavior, issue recurrence, and overall application performance. Each recorded entry contains a unique issue identifier, a brief description of the problem, the affected feature or module, and relevant testing details to assist with analysis, prioritization, and future improvements.

BUGS FOUND IN THE PASSENGER APP

27th April 2026

BUG ID	BUG TITLE
BUG_P_001	Ride status and live location are not updated after trip start
BUG_P_002	Unable to add stops for the ride

29th April 2026

BUG ID	BUG TITLE
BUG_P_003	Ride duration doesn't change due to traffic delays
BUG_P_004	Map route does not update when taking an alternative route
BUG_P_005	Delay in live map location updates

BUGS FOUND IN THE DRIVER APP

11th May 2026

BUG ID	BUG TITLE
BUG_D_001	Ride details doesn't update on the real time
BUG_D_002	Distance and duration mismatch compared to google maps
BUG_D_003	Unable to send messages with emojis or special content to passenger
BUG_D_004	Unable to end multi-drop ride before final stop
BUG_D_005	Driver and passenger showing different routes for the same ride

27th May 2026

BUG ID	BUG TITLE
BUG_D_006	Ride request notification received, but no trip appears in the app
BUG_D_007	Incorrect destination location displayed in the application
BUG_D_008	Nearby driver does not receive ride request
BUG_D_009	Ride request not displayed and auto accepted without driver interaction

DETAILED ANALYSIS OF THE BUGS FOUND IN THE PASSENGER APP

27th April 2026

BUG_P_001

TITLE

Ride status and live location are not updated after trip start

DESCRIPTION

After the ride is initiated by the driver, the passenger application fails to update the trip progress in real time. Despite the vehicle being in motion for several minutes, the live tracking feature continues to display the passenger at the original pickup location instead of reflecting the ongoing journey toward the destination. Additionally, the ride status and map interface remain static throughout the trip, causing inaccurate trip monitoring and a poor user experience.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Ensure that real-time GPS location data is continuously synchronized between the driver and passenger applications once the ride has started.
- Minimize delays in transmitting location updates to the server to improve live tracking accuracy and responsiveness.
- Implement an automatic map refresh mechanism to recover from situations where the live location remains stuck at the pickup point during an active trip.

BUG_P_002

TITLE

Unable to add stops for the ride

DESCRIPTION

When attempting to request a ride with multiple stops, the application fails to allow additional stop locations to be added successfully. An error message stating, *"This stop is the same as the previous or next location. Please choose a different destination."* is displayed even when different locations are selected. As a result, users are unable to proceed with booking rides that include multiple stops, affecting the ride planning functionality and overall user experience.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use proper place IDs instead of names or text to check whether stops are the same.
- Improve location checking so only truly identical or very close locations are flagged as duplicates.
- Allow different valid stops and only block exact duplicates with clear matching rules.
- Show a clearer error message so users understand why the stop is rejected.
- Make sure both frontend and backend use the same rules for validating stops.

OVERALL SUGGESTIONS FOR THE DAY – 27TH APRIL

SUG_P_001

TITLE

Multi-stop ride progress tracking

DESCRIPTION

For rides with multiple destinations, introduce a trip progress tracker that clearly displays the status of each stop. Completed destinations should be marked as finished, the current stop should be highlighted, and remaining stops should appear as upcoming. This allows passengers to easily follow the progress of their journey in real time.

IMPROVEMENTS

- Display a completion icon or label for finished stops.
- Emphasize the active destination currently in progress.
- Show remaining destinations as pending or upcoming.
- Automatically refresh the stop status after each destination is reached.

EVIDENCE

29th April 2026

BUG_P_003

TITLE

Ride duration doesn't change due to traffic delays

DESCRIPTION

When the ride encounters traffic delays or extended waiting periods, the total ride duration displayed in the passenger application does not update accordingly. Despite the trip taking longer than expected, the system continues to show the original estimated duration, resulting in inaccurate trip information and a misleading user experience.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use real-time GPS updates to continuously track vehicle movement instead of relying on the initial route.
- Recalculate ETA dynamically using live traffic data and current vehicle speed.
- Trigger route and duration updates when the driver deviates from the original path.
- Improve update frequency between backend and frontend to keep trip data in sync.
- Separate planned duration from live duration so traffic delays are reflected accurately.

BUG_P_004

TITLE

Map route does not update when taking an alternative route

DESCRIPTION

When the driver takes a shortcut or deviates from the originally suggested route during the ride, the map interface fails to update the trip route accordingly. Instead of reflecting the current path being taken, the application continues to display the original route, causing inaccurate live tracking and confusion for passengers during the journey.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use live GPS updates instead of relying only on the original route.
- Recalculate the route when the driver takes a different path or shortcut.
- Show both the planned route and the actual route on the map.
- Improve GPS accuracy using road snapping (match location to roads).
- Ignore small GPS errors but update when the driver clearly changes direction.
- Increase how often location updates are sent to keep the map moving smoothly.
- Make sure frontend and backend follow the same rules for updating the route.

BUG_P_005

TITLE

Delay in live map location updates

DESCRIPTION

After the ride begins, the passenger application fails to reflect the driver's movement on the live map in real time. The vehicle location updates with noticeable delays, causing the map marker to appear static or lag behind the actual position of the driver. As a result, the passenger cannot accurately track the ongoing trip, leading to confusion and reduced trust in the tracking feature.

SUGGESTED SOLUTIONS

- Increase GPS update frequency to ensure smoother and more real time driver movement on the map.
- Use Web Sockets or real-time streaming instead of relying only on periodic polling.
- Apply location interpolation to smoothly animate movement between received GPS points.
- Optimize backend processing so location updates are pushed immediately without delay.
- Improve GPS filtering and road-snapping to reduce noise while keeping updates responsive.

OVERALL SUGGESTIONS FOR THE DAY – 29TH APRIL

SUG_P_002

TITLE

Allow editing the ride by adding or removing stops during the trip.

DESCRIPTION

During an ongoing ride with multiple destinations, the application should allow flexible modification of the route by adding or removing stops as needed. A clear trip progress tracker should be displayed, showing completed stops as finished, the current stop as active, and upcoming stops as pending. This ensures passengers can easily monitor journey progress while also adapting the route in real time based on changing requirements or conditions.

IMPROVEMENTS

- Allow real-time addition and removal of stops during an active trip without restarting the ride.
- Automatically recalculate the route and ETA whenever a stop is modified.
- Notify both driver and passenger immediately when a stop is added, removed, or rearranged.
- Restrict edits after certain ride stages (e.g., near final destination) for safety and stability.
- Validate new stops before confirming (avoid invalid locations, duplicates, or unsafe routes).

EVIDENCE

11th May 2026

BUG_D_001

TITLE

Ride details doesn't update on the real time

DESCRIPTION

After the ride starts, the application fails to update key ride details in real time. Information such as route progress, trip status, and current location remains outdated or static instead of reflecting the ongoing journey. As a result, passengers do not

receive accurate live updates about the trip, leading to confusion and reduced visibility of ride progress.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use real-time GPS updates to continuously sync ride details instead of relying on static or cached data.
- Recalculate ride information (route, ETA, status) whenever new location data is received from the driver.
- Maintain a single centralized trip state so all updates are reflected instantly across all screens.
- Trigger automatic UI refresh when key ride events occur such as movement, stop updates, or route changes.
- Optimize backend-to-frontend data flow to reduce latency and ensure near real-time updates.

BUG_D_002

TITLE

Distance and duration mismatch compared to google maps

DESCRIPTION

The application displays ride distance and duration values that differ significantly from those shown in Google Maps for the same route. The estimated travel time and total distance appear inaccurate or inconsistent, leading to confusion for users when comparing with trusted navigation sources. This mismatch reduces user confidence in the system's reliability and affects overall trip planning and expectations.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use one reliable map API (like Google Maps or Mapbox) for all distance and route calculations.
- Make sure distance and duration come from the same routing system.
- Include real-time traffic data when calculating travel time.
- Use a consistent route selection method across the app.
- Regularly compare results with Google Maps to improve accuracy.

BUG_D_003

TITLE

Unable to send messages with emojis or special content to passenger

DESCRIPTION

After the ride begins, the application does not allow the driver to end the trip before arriving at the final drop location. Even in valid scenarios such as passenger request changes, emergencies, or route adjustments, the system blocks ride completion until the predefined destination is reached. As a result, users are unable to properly close or finalize the trip, leading to poor flexibility and reduced control over ride management.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Support UTF-8 encoding so emojis and special characters can be sent properly.
- Allow all message content types by properly validating and processing input.
- Ensure backend and frontend both support Unicode text.
- Fix message handling so emojis and functions don't get blocked or broken.
- Show plain text as a fallback if formatting fails.

BUG_D_004

TITLE

Unable to end multi-drop ride before final stop

DESCRIPTION

During a multi-drop ride, the application does not allow the ride to be ended before reaching the final drop location. Even if earlier stops are completed or the passenger wishes to end the trip early, the system forces the ride to continue until the last destination is reached. This limits flexibility in managing trip completion and causes inconvenience when ride plans change mid-journey.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Allow ride completion from any active or intermediate stop, not only the final destination.
- Add a confirmation step before ending the ride early to prevent accidental completion.
- Update backend logic to support partial completion of multi-drop trips.
- Automatically adjust remaining stops when the ride is ended early.
- Notify all users when a ride is ended before the final drop point.

BUG_D_005

TITLE

Driver and passenger showing different routes for the same ride

DESCRIPTION

In some cases, the driver and passenger applications display different routes for the same ongoing ride. The driver may follow one navigation path while the passenger app shows a different or outdated route. This inconsistency leads to confusion, inaccurate trip tracking, and reduced trust in the system, as both users are not aligned on the actual journey being followed.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Use a single backend route source so both driver and passenger apps receive the same route data.
- Synchronize route updates in real time whenever the driver changes direction or path.
- Ensure both apps use the same mapping and routing API for consistency.
- Push route updates through real-time communication (e.g., WebSockets) instead of separate calculations.
- Regularly validate route data to prevent mismatches between driver and passenger views.

OVERALL SUGGESTIONS FOR THE DAY – 11TH MAY

SUG_D_001

TITLE

Allow drivers to view full trip details before accepting the ride

DESCRIPTION

Before accepting a ride request, the driver should be able to view complete trip details including all stops, total distance, estimated duration, route overview, and fare breakdown. Currently, limited information is shown, which prevents drivers from making informed decisions. Providing full trip visibility helps drivers better evaluate the ride and improves transparency and acceptance accuracy.

IMPROVEMENTS

- Show complete trip details including all stops, distance, duration, and fare before ride acceptance.
- Display a full route preview on the map for better trip understanding.
- Provide stop-by-stop breakdown for multi-destination rides.
- Include traffic-based ETA to reflect realistic travel time.
- Allow drivers to accept or reject rides based on complete trip information.

EVIDENCE

SUG_D_002

TITLE

Time-limited access to passenger contact information for drivers

DESCRIPTION

After a ride is completed, drivers currently lose the ability to contact the passenger. In cases such as lost belongings, fare clarifications, or other ride-related follow-ups, this limitation creates difficulties in resolving issues. Providing temporary access to passenger contact details would help drivers handle post-trip concerns more effectively while still maintaining user privacy.

IMPROVEMENTS

- Allow drivers to reach passengers for a limited time (e.g., 24 hours) after trip completion.
- Use masked or anonymized contact methods to protect personal information.
- Add a “Contact Passenger” feature within ride history or completed trip details.
- Automatically disable access once the allowed time period expires.

SUG_D_003

TITLE

Enhance activity section UI with clear status colour indicators

DESCRIPTION

In the activity or history section, users can filter completed and cancelled trips, but there is currently no strong visual distinction between different ride statuses. This makes it harder to quickly understand trip outcomes. Adding clear color indicators and labels would improve readability and allow drivers to identify trip statuses more efficiently.

IMPROVEMENTS

- Highlight completed trips using a light green colour indicator or label.
- Highlight cancelled trips using a light red colour indicator or label.
- Add clear status badges such as “Completed” and “Cancelled” for each trip.
- Improve overall layout and spacing to make activity history easier to scan and understand.

27th May 2026

BUG_D_006

TITLE

Ride request notification received, but no trip appears in the app

DESCRIPTION

The driver receives a notification indicating that a new ride request has been assigned or is available. However, when the driver opens the application, no corresponding trip request is displayed on the ride acceptance screen. This creates confusion and may result in missed ride opportunities, as drivers are unable to view or accept the notified trip request.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Ensure ride request data is synchronized immediately when a notification is sent.
- Automatically refresh the ride request screen when the driver opens the app from a notification.
- Validate that trip requests are properly assigned and available before sending notifications.
- Display an error message or status update if the ride request has expired or been reassigned.
- Improve notification and backend synchronization to prevent missing or delayed trip requests.

BUG_D_007

TITLE

Incorrect destination location displayed in the application

DESCRIPTION

The destination location shown in the application is incorrect and does not match the passenger's intended destination. When navigation is opened through Google Maps, it also directs the driver to the same incorrect location. As a result, the passenger's actual destination is located elsewhere, causing navigation errors, confusion, and potential delays in completing the trip.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Validate destination coordinates before creating the ride request.
- Ensure the correct latitude and longitude are passed to Google Maps navigation.
- Display a map preview so users can verify the selected destination before confirming the ride.
- Improve location search and pin selection accuracy to reduce incorrect destination mapping.
- Allow passengers and drivers to report or correct an incorrect destination during the trip.

BUG_D_008

TITLE

Nearby driver does not receive ride request.

DESCRIPTION

When a passenger requests a ride, a driver who is located very close to the pickup location does not receive the ride request notification. Despite being the nearest available driver, the request is either delayed, assigned to another driver, or not delivered at all. This results in missed ride opportunities and may increase passenger waiting time unnecessarily.

SUGGESTED SOLUTIONS

- Improve driver-passenger matching logic to prioritize the nearest available drivers.
- Ensure ride requests are delivered instantly to eligible nearby drivers.
- Regularly update driver location data to maintain accurate proximity calculations.
- Add monitoring and logging to detect missed or failed ride request assignments.
- Improve notification reliability to prevent delays in ride request delivery.

BUG_D_009

TITLE

Ride request not displayed and auto accepted without driver interaction

DESCRIPTION

Passenger requests a ride, the request does not appear on the driver's application interface. Instead, the system automatically accepts the ride without showing any visible request popup or allowing the driver to manually accept or reject it. This prevents the driver from reviewing trip details beforehand and reduces control over ride selection, leading to confusion and poor user experience.

SCREENSHOTS

SUGGESTED SOLUTIONS

- Ensure all ride requests are clearly displayed on the driver's screen before any acceptance.
- Remove or control automatic ride acceptance unless explicitly enabled by system rules.
- Add a visible popup with accept/reject options for every incoming ride request.
- Improve notification delivery so ride requests cannot be missed or skipped.
- Add logging and debugging to track why ride requests are not being rendered on the UI.

OVERALL SUGGESTIONS FOR THE DAY – 27TH MAY

SUG_D_004

TITLE

Time-limited driver access to passenger contact information

DESCRIPTION

After a trip is completed, drivers currently lose the ability to reach the passenger. This becomes problematic in situations such as lost belongings, payment clarifications, or other ride-related follow-ups. Providing temporary access to passenger contact details after trip completion would help drivers resolve such issues more effectively while still maintaining user privacy and security.

IMPROVEMENTS

- Allow drivers to contact passengers for a limited time period (e.g., 24 hours) after the ride ends.
- Use masked or privacy-protected contact methods instead of exposing full personal details.
- Include a "Contact Passenger" option within completed trip or ride history screens.
- Automatically revoke access once the allowed time window expires.

TEST CASE SCENARIOS TESTED

The following test case scenarios were executed to evaluate the functionality, reliability, and overall performance of the MiWAYZ Passenger and Driver applications. These scenarios were designed to simulate real-world ride-hailing activities, including ride requests, trip tracking, navigation, notifications, and ride completion processes. Each test case was performed to verify that the system behaves as expected under different operating conditions. The testing also helped identify defects, synchronization issues, and areas for improvement within the application. The results obtained from these scenarios provided valuable insights into the stability and usability of the platform.

Day 3	C62	Google Maps Navigates to Correi Driver		5	Trip active with confirmed drop location	Driver taps Navigate, Google Maps opens	Google Maps loads with actual passenger drop. Not	Pass
Day 3	D33	Driver Not Blocked by Phantom F Driver		5	Driver completed previous cash trip, marked a	Driver attempts to accept new trip	Driver can accept new trip without seeing current tri	Pass
Day 3	D34	Early End Trip Charges Partial F Driver + Passenger		5	Trip estimated at LKR 800, driver ends trip at	End trip mid-route, observe charged fare	Fare reflects actual distance and time. NOT full LKR	Pass
Day 3	D35	No Stuck Calculating Fare on We Driver		5	Trip ending at drop-off with weak connectivity	Driver taps End Trip	Fare computed within 10 sec or graceful fallback. Nc	Pass
Day 3	D36	Fare Tolerance Threshold — With Driver + Passenger		3	Estimated fare LKR 500, actual computed LK	Complete trip, observe final charge	Final fare stays at estimate (within tolerance). No su	N/A
Day 3	D37	Fare Tolerance Threshold — Bey Driver + Passenger		3	Estimated fare LKR 500, actual computed LK	Complete trip, observe final charge and notific	Final fare recalculated to actual. Both passenger an	N/A
Day 3	D38	Driver Subscription Active Before Driver		3	Driver with expired time-based subscription	Driver attempts to go online and accept requ	System blocks acceptance with clear renewal CTA. I	N/A
Day 3	D39	Ride-Count Subscription Decrem Driver		3	Driver on ride-count subscription with 5 rides	Complete 1 ride, observe remaining count	Count decrements to 4 within 30 sec of trip end. Nev	N/A
Day 3	F26	Trip Auto-Syncs to Completed Aft Passenger		3	Passenger on active trip, connection drops	Force airplane mode for 5+ min while driver α	Passenger app auto-syncs trip to Completed without	N/A
Day 3	F28	Active Trip Restored on Home Aft Driver		3	Driver on active trip, app force closed, networ	Restore network, reopen app	Active trip visible on home screen within 5 sec. Resu	Pass
Day 3	F29	Mobile Data Toggle Off-On Mid-Ti Driver		5	Driver on active trip	Turn off mobile data, wait 30 sec, turn back on	End Trip succeeds after reconnect. No stuck state. f	Pass
Day 3	F30	WhatsApp Call During Active Trip Driver + Passenger		3	Driver on active trip with WhatsApp installed	Driver receives WhatsApp call, answer briefly, Trip continues normally on both sides. No frozen sta		Pass
Day 3	I21	PIN Autofill Does Not Freeze Ph Driver		3	Realme/Vivo/budget Android device, OTP key	Request OTP at login, wait for auto-fill, tap au	OTP fills without freezing. App proceeds within 3 sec	Pass
Day 3	I22	Google Play Services Outdated Driver		3	Device with outdated Play Services	Open MiWayz app	App detects outdated Play Services. Shows clear up	N/A
Day 3	I23	iPhone 12 / 12 Pro Map Performs Driver + Passenger		3	iPhone 12 / 12 Pro with iOS 15+	Open app, pan map, zoom, watch driver mark	Map renders smoothly. No freeze. Driver positions u	N/A
Day 3	I24	Low-End Android Performance B Driver + Passenger		5	Test on Pixel 5, Vivo Y20, Infinix entry-level, S	Run full driver-passenger trip on each device	No crashes. App responsive (under 3 sec for any ac	N/A
Day 3	I25	Foreground Notification Does Not Driver		3	Driver or Passenger on app foreground	Receive high-priority push notification (any ap	Notification opens. MiWayz does not crash on dismi	Pass
Day 3	I28	Passenger Switches MiWayz to N Passenger		3	Passenger requesting trip	Open Google Maps to check route, switch bac	MiWayz resumes from same state. No fresh load. R	N/A
Day 3	I29	Low RAM Device Recovers State Driver		3	Driver on entry-level 2GB RAM device	Open 4-5 heavy apps after going online with	MiWayz recovers state via re-sync. Driver still online	N/A
Day 3	UX14	In-Trip Safety Features Comparis Passenger		2	Trip active	Look for emergency button, share trip, driver	Safety features rated against Uber/PickMe. Trust sci	N/A
Day 3	UX15	Driver Examine Transparency Driver		2	Driver completed several trip	View examine screen, compare breakdown of	Participate examine, commission/subscription details	3

PILOT TESTING PROGRESS UPDATES

Pilot testing continued after the four testing sessions documented in the detailed bug analysis sections. During the subsequent testing period, additional test cases and real-world ride scenarios were carried out to further evaluate the functionality, reliability, and overall performance of both the Passenger and Driver applications.

Although testing continued, no significant new bugs or issues requiring detailed documentation were identified during the remaining testing days. Minor observations and expected system behaviours were monitored throughout the testing process, while previously identified issues and key functionalities continued to be tested.

Therefore, the detailed bug analysis in this report focuses on the four testing sessions where notable and reportable issues were identified. The continued testing activities are supported by the progress updates and communication evidence provided below.

The following screenshots provide evidence of the coordination, communication, and progress updates shared among participants throughout the pilot testing phase. These discussions helped track testing activities, report issues encountered, verify completed test cases, and facilitate collaboration between team members. The screenshots serve as supporting evidence of the overall pilot testing execution and monitoring efforts.

CONCLUSION

This pilot testing phase identified several functional issues, synchronization delays, and UI/UX gaps in both the Passenger and Driver applications of MiWAYZ. The testing was conducted across key real-world ride scenarios such as live tracking, ride requests, navigation, fare calculation, notifications, wallet updates, and trip completion, helping to evaluate system behaviour under practical conditions.

A total of 14 bugs were recorded during testing, mainly related to real-time updates, ride state management, notifications, route accuracy, connectivity handling, and background processing. These issues may impact user experience and system reliability during active rides. In addition to bugs, several improvement areas were also identified to enhance performance and usability.

Overall, MiWAYZ demonstrates a strong core ride-hailing structure, but requires improvements in real-time synchronization, data accuracy, and interface responsiveness. Addressing these issues will significantly improve system stability, user experience, and future scalability.
